

AI Interview Coach — Full Implementation Flow (Step 1 to Finish)

Each box = one working section. Purple = main path · green = AI/online · red = proctoring/fail · gold = decision.

CROSS-CUTTING LAYERS (used by many steps)

AI Dispatch — call_ai()

Router → Claude Opus 4.8 / GPT-5.5 / Gemini 3.5.
Model picker + Custom field, 3-stage: Gen→Eval→Coach.
Shared keys (secrets/env) → every user gets access.
Graceful errors. Offline → local scorers instead.

Proctoring

Lockdown JS (shortcuts, tabs, DevTools).
Camera self-view + auto face snapshot (the real gate).
Human-voice meter (FFT 300-3400Hz + modulation).
Gaze (FaceMesh): 2 turns → 1 red warning → 4th fails.

Storage (local JSON)

users.json — accounts + hashed passwords + role.
sessions.json — every interview result.
leaderboard.json · custom_interviews.json (codes).
Shared with the recruiter dashboard app.

Whole UI is a finite-state machine driven by st.session_state["stage"]: company_select → setup → syscheck → interviewing → (terminated | results).
Reliable: auth, scoring logic, dashboard, offline mode, PDF export. Best-effort: in-browser camera/gaze/voice (needs localhost or https; a deterrent, not tamper-proof).
